

CSL Behring and CSL Plasma: Our guiding principles for efficient health, security, environmental and energy policies

Health protection, occupational safety, environmental protection and energy efficiency are not only legal requirements for CSL Behring and CSL Plasma, but essentials of our own identity. We want to provide a safe work environment to our employees that harms neither people nor nature.

Legal requirements are only the minimum:

It is a matter of course for us to fulfill the legal requirements. In addition, we strive to establish our own standards that exceed the legal requirements if this further improves the well-being of our employees and the protection of the environment.

Including all our employees:

Continuous improvement of our measures concerning environmental protection, energy efficiency, occupational safety and health protection is part of the responsibility of all our employees. Through regular information campaigns and training, we strengthen their awareness and commitment to environmentally friendly and safe practices.

Including all our products and production steps:

Our processes, including plasma collection, production, filling, packaging, warehousing and transportation, are designed to minimize risks for people and nature. Furthermore, questions of occupational safety, environmental protection and energy efficiency are already taken into consideration during the procurement of raw materials, auxiliary materials and operational supplies as well as energy carriers, products and services.

Preventive action:

CSL Behring and CSL Plasma practice preventive environmental and health protection with the aim of avoiding or minimizing hazards and associated risks. The determination of our enterprises to remain attractive and responsible employers is evident in our efforts to create a safe work environment, define protective measures, prevent accidents, preserve the livelihoods of people and nature, and conserve natural resources. All employees at CSL Behring and CSL Plasma are committed to safe and responsible work practices.

Selection of contractors:

When selecting our contractual partners, we attach great importance to ensuring that the standards they apply to their environmental protection and occupational safety behavior are comparable to ours.

Information:

We inform our employees, business partners, authorities and the public about our activities regarding environmental protection and occupational safety.

Health protection, occupational safety, environmental protection and energy efficiency do not only mean designing safe workspaces and working procedures, the economical use of natural resources and a reduction in emissions, wastes and waste waters. They are also an indispensable part of a wider program that includes further measures.

Management system:

All aspects of our environmental, security and energy policies are part of a comprehensive management system. All activities regarding environmental impact, security and energy efficiency are continuously being reviewed and evaluated. We provide the resources required to fulfill the necessary tasks within our management system.

Continuous improvement:

We strive to continuously improve our measures regarding health protection, occupational safety, environmental protection and energy efficiency. Regular evaluation, organization and the setting of annual targets regarding these measures guide this continuous improvement process.

Responsibility:

We are aware of our responsibility to the public and the environment. Therefore, involvement in publicly and government-sponsored initiatives in environmental protection and energy efficiency as well as occupational safety and health is a matter of course for us.

Monitoring and control:

In order to monitor and control our systems regarding health protection, occupational safety and environmental protection, we conduct annual audits in accordance with defined processes. This enables us to ensure that our systems are working efficiently and in compliance with internal and regulatory requirements. The audit results are documented and included in the reporting of the CSL Group.
